One Size Doesn't Fit All

- 👗 Imagine wearing the same dress:
  - For a child
  - For an adult
  - For a tall person
- ❌ Will it fit everyone perfectly?

- 🤔 So... how do websites adapt to different devices?

RESPONSIVE DESIGN

TODAY THERE ARE A VARIETY OF DEVICES WITH DIFFERENT SCREEN SIZES SO WEBPAGES NEED TO ADAPT FOR A MORE FUNCTIONAL USER EXPERIENCE

WEBPAGE APPEARS DIFFERENT BETWEEN DIFFERENT DEVICES

DESKTOP

LAPTOP

TABLET

MOBILE

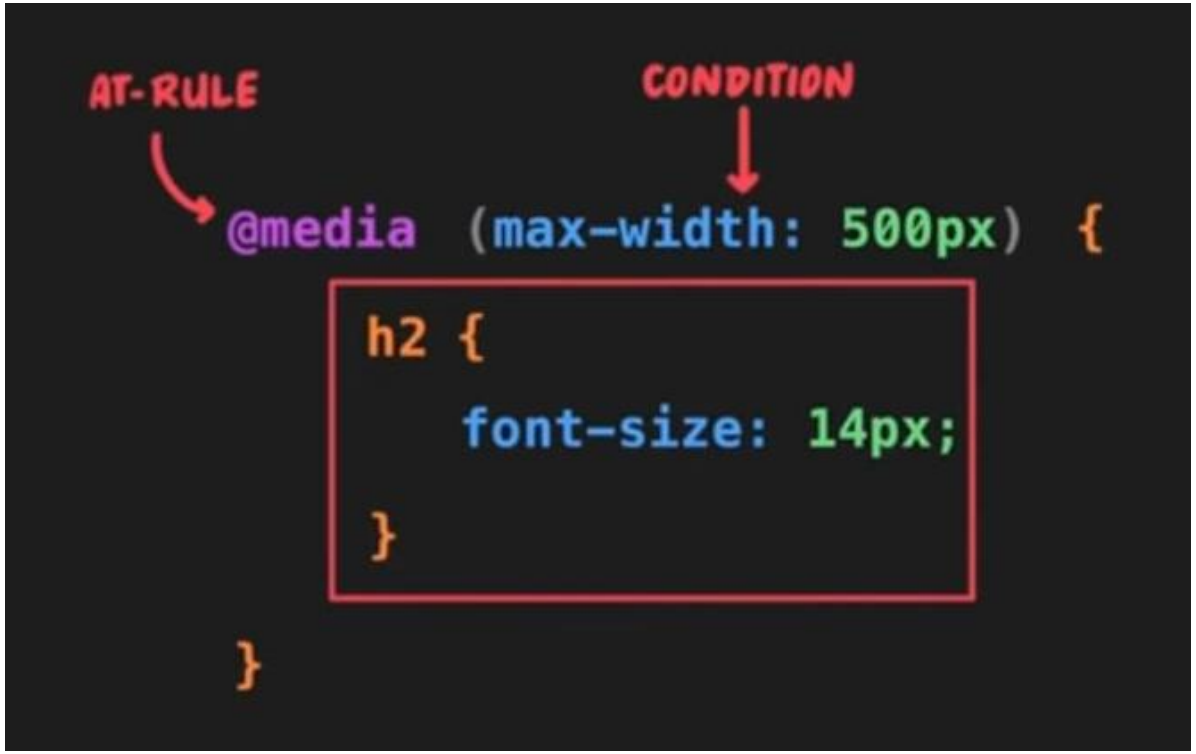
What is Media Query?

Media Queries are CSS techniques used to apply styles based on characteristics like screen size, device type, or other features.

They enable the creation of responsive web designs, adjusting layouts for optimal display on various devices and screen sizes.

Media Queries Syntax



- **@media** → Keyword to define media query
- **mediatype** → Type of device (e.g., screen, print, all)
- **condition** → When to apply styles (e.g., max-width, min-width)
- **CSS Block** → Styles applied when condition is true

Media Types

Value	Description
all	Used for all media type devices(default)
print	Used for printers.
screen	Used for smartphones, computer screens, tablets, etc.
speech	Used for screen readers.

```
<style>
    h1{
        color: blue
    }

    @media print{
        h1{
            color: red;
        }
    }
</style>

<div>
    <h1>Hello</h1>
</div>
```

If you run this code on browser initially you will see blue colour
But when you go to the print screen (ctrl+p) you will see red color

@media <Device>

Screen - Width

max-width

```
@media screen and (max-width: 600px) {
        div{
            background-color: black;
        }
    }
```

min-width

```
@media screen and (min-width: 600px) {
        div{
            background-color: black;
        }
    }
```
